Single-cell lipidomics: The combination of single-cell MALDI-MS and immunocytochemistry allows metabolic information to be directly coupled to canonical cell type. Analysis of over a thousand single cells shows that many lipid species have a high similarity between neurons and astrocytes, although seventeen lipid species differed significantly between the two cell types, including four ...

Reverse osmosis (RO) is a water purification technology that uses a partially permeable membrane to remove ions, molecules and larger particles from drinking water. In reverse osmosis, an applied pressure is used to overcome osmotic pressure, a colligative property, that is driven by chemical potential differences of the solvent, a thermodynamic parameter.

A comparison of alginate fouling in forward osmosis (FO) with that in reverse osmosis (RO) was made. A key experimental finding, corroborated by membrane autopsies, was that FO is essentially more prone to fouling than RO, which is opposite to a common claim in the literature where deductions on fouling are often based solely on the water flux profiles.
